

Fringelsland — Rebuilding The Hub

A plain-language guide to the plan · where we are & what's next · 28 June 2026

Fringelsland is an edutainment platform for group-based personal development, built around three questions: *Who am I? What do I want? How do I get there?* **The Hub** is its first surface — the web app people and groups actually use. We are rebuilding the Hub cleanly ("v2"): an earlier prototype proved the idea but broke the architecture we've since designed, so we keep the proven database underneath and rebuild the app on top, area by area, always keeping a working product.

1 · The journey in five phases

The whole rebuild runs in five phases. We are well into the build phase.

Phase	What it does	Status
0 · Decide	Lock the decision to rebuild rather than patch	Done
1 · Aim	Refresh the target spec; audit what the database already gives us; catalogue the old app's behaviours	Done
2 · Foundation	A thin "walking skeleton" running end-to-end the right way (sign in → see your groups)	Done
3 · Build area by area	Build each part of the Hub in dependency order, one area at a time	Active — in the first area
4 · Cut over	Once every area is rebuilt, switch over and retire the old app	Upcoming

2 · The Hub is built in "areas"

An **area** is a coherent slice of the Hub — a family of related things a person can do. There are eight. Phase 3 builds them in **dependency order**: the things everything else needs come first. Each area is, in turn, made of small numbered **capabilities** (single things a person can do).

Area	In plain words	Size	Where it sits
Identity (A-IDN)	Who you are: arriving, signing up, your profile, consent, your account, leaving	12	Active now
Groups (A-GRP)	The groups you belong to and your role in each	19	Next
Journeys (A-JRN)	The structured experiences you travel through	18	Then
Communication (A-COM)	Messages, forums, talking with others	15	Then
Notifications (A-NTF)	Being told when something that matters happens	10	Then
Platform Operations (A-ADM)	Behind-the-scenes admin that keeps the platform healthy	18	Then
Companion & Insight (A-COI)	Your AI companion and reflective insight	7	Later — needs other engines first
Discovery (A-DIS)	Finding journeys, groups and people	7	Later — needs other engines first

106 capabilities in total. We've completed the foundation of the first area; the hardest part (the anonymous-to-member identity machinery) is already behind us.

3 · Right now: the Identity area

Identity has 12 capabilities. The four that **everything else depends on** are done — a person can arrive anonymously, become a full member, sign in and out, and view/edit their profile. That means the rest of the Hub is already unblocked. Eight capabilities remain in Identity.

Done (the foundation everything builds on)

ID	What it means	Status
IDN-1	Arrive anonymously and look around, no sign-up needed (the "Mist")	Done
IDN-2	Turn an anonymous visit into a real account — or say goodbye and be erased	Done
IDN-3	A real, lasting member identity: sign in, sign out, stay signed in	Done
IDN-4	See and edit your profile (name, display name, bio, visibility) + the account menu	Done

Remaining (what's left to finish Identity)

ID	What it means (plain language)	Leans on (platform)	Cycle
IDN-9	See your account's state — active, deactivated, or closed	Identity	A
IDN-12	Reactivate your own account after deactivating it	Identity, Governance	A
IDN-6	See what you've consented to, and the history of those choices	Governance	B
IDN-7	Change consent and fine-grained sharing controls (what others see)	Governance, Groups	B
IDN-8	Request and download a complete export of your data	Governance	C
IDN-5	A private personal Journal only you can see	Identity	D
IDN-11	See your signed-in devices and sign out of others remotely	Identity	E
IDN-10	Delete / leave the platform — erase your account	Identity, Governance, Groups, Journeys, Communication	F · deferred

The order we'll build them (each "cycle" is one focused slice)

- **Cycle A — Account lifecycle:** see your account state (IDN-9), then reactivation (IDN-12). Lightest, and it underpins the rest.
- **Cycle B — Consent & privacy:** view your consent & history (IDN-6), then change consent & sharing (IDN-7).
- **Cycle C — Your data:** full data export (IDN-8).
- **Cycle D — Reflection:** the private Journal (IDN-5).
- **Cycle E — Devices:** per-device sessions & remote sign-out (IDN-11) — after a quick check that our auth provider supports it.
- **Cycle F — Leaving:** self-service account deletion (IDN-10) — **deferred on purpose**, see below.

The one tricky dependency: deleting your account (IDN-10)

This is exactly the kind of cross-area dependency worth calling out. **Erasing an account isn't only an Identity action** — if you belong to a group and you're enrolled in a journey, deletion has to ripple outward: remove you from the group, freeze your journey enrolment, decide what happens to anything you posted in forums. Those touch the **Groups, Journeys** and **Communication** areas.

Why this doesn't block us. That ripple is handled *underneath* the app, in the shared database (with safety rules and an automatic cascade), not by the Identity screen reaching into the Groups screen. Much of it already exists from the old system and carries forward. So we don't need the Groups or Journeys *screens* built to delete an account correctly.

Why we still defer it. The fully correct, up-to-date cascade leans on the Journeys engine and the forum/content engine, which come online when we build those *later* areas. So deletion is built in two natural steps: the enrolment part lands once **Journeys** is built, and the final piece once **Communication** is built — at which point IDN-10 is finished.

How we make sure it isn't forgotten. It's anchored to the events that unblock it: a parked spec that our documentation health-check flags the moment its blocker clears, an explicit "what's left" cascade document, re-entry reminders attached to the Journeys and Communication areas, and an entry in the cross-cutting gaps register.

A useful rule of thumb on dependencies

An "area" is really a set of **screens** (what a person sees and does). The shared logic that spans areas — cascades, permissions, who-can-see-what — lives in the **platform underneath**, not in any one area's screens. That separation is what lets us build screens one area at a time without getting blocked: the cross-area work is done once, in the platform, and every screen just asks for it. Account deletion is the main place this matters; everything else in Identity stands on its own.

4 · What happens next

We build in two alternating kinds of working session, staying a step ahead on planning:

- **Plan a cycle:** write the detailed, ready-to-build spec for both the screen and the platform piece beneath it.
- **Build a cycle:** build the platform piece first (with its review for any database change), then the screen on top, test-first, until it's done and shipped.

The immediate next step is to **plan Cycle A** (account state + reactivation). After Identity is complete, we move to **Groups** — the social foundation that unlocks Journeys, Communication and Discovery — and onward in the order above, finishing account deletion along the way and ending with the cut-over to the new Hub.
